Screen for autoimmune type 1 diabetes now

Taking proactive steps gives time to plan and prepare—and could even help reduce the risk of life-threatening complications at diagnosis. Talk to your doctor today!

Type 1 diabetes can affect anyone, regardless of age, family history, or lifestyle choices. However, if a family member has it, your risk increases up to **15 times**. Additionally, the risk of developing T1D can be **2-3 times higher** if you have another autoimmune disease, such as Hashimoto's, Graves', or celiac disease.

A blood test can spot type 1 diabetes early—before serious complications at diagnosis may happen and insulin is needed

Autoimmune type 1 diabetes (T1D) starts in the body **long before there are any visible signs or symptoms**. Typically, T1D is only diagnosed after symptoms appear, when a person is unable to make enough insulin and potentially life-threatening complications, like diabetic ketoacidosis (DKA), can happen without warning.

Type 1 diabetes is an autoimmune disease

Autoimmune type 1 diabetes happens when the immune system mistakenly attacks insulin-making cells called **beta cells**. The attack on beta cells starts long before people develop symptoms and need insulin injections. **The early (or pre-insulin dependent) stages of type 1 diabetes** are when 2 or more diabetes-related **autoantibodies** are found in the blood. Screening with a blood test using a finger stick or blood draw can help detect autoimmune type 1 diabetes early.

Why should you screen?

Know the options

Advancements in treatment and management of autoimmune type 1 diabetes may offer ways to help. Talk to your or your loved one's doctor about what could come next. You or your loved one may be able to participate in a clinical trial or explore available treatment options.

Learn the symptoms

By knowing if you or your loved one is in the early stages of autoimmune type 1 diabetes, you can be better prepared to recognize symptoms when they appear. This can help you understand what's ahead and lower the risk of potentially life-threatening complications like diabetic ketoacidosis (DKA) with a doctor's help.

Prepare for what's ahead

Knowing if you or your loved one has early-stage type 1 diabetes can give you time to plan ahead. Living with type 1 diabetes means taking on new responsibilities, and there is a learning curve that comes with managing it.
